

# Extended Basic HTML and CSS

---

Overall, our goal with this workshop is to completely cement and solidify our understanding of basic HTML and CSS concepts and make sure that we're stylistically and semantically hitting all of our marks as to how the code is written. Here are some tasks you can do to get there:

- Create a basic web page that illustrates use of all of the tags that you've learned so far. Think of it is a "cheat sheet". Make sure that all code is indented correctly and you've semantically laid out the page correctly.
- Find another article on the Onion or a similar news source. Without viewing the source, recreate the "article" part of the page (no navigation bar, etc).
- Create a very basic website with multiple pages that link to each other using link HTML tags. The website should be about an animal i.e. the gazelle. Include a photo gallery page, a page with information about the animal separated by heading, and a page with links to external resources about the animal. Use a `<ul>` tag and `<li>` wrappers for all navigation links at the top of the page.
